

The Lost World Museum's Starter Guide

The Lost World Museum began in 2005. Its mission has one purpose, explore the origins question of whether it's **Apes, Aliens, or Adam**

Where did we come from?

The importance of this question cannot be undervalued, for in it, is the beginning point for all our trajectories in life. The museum believes comparing and contrasting the similarities and differences of each theory will be better equip people to choose the best answer.

What are the 3 Theories?

There are 3 popular answers or theories to this question on origins. We've summed them up while characterizing each worldview in a fun and memorable way- **Apes, Aliens, or Adam?**

Apes: Biological Evolution - this theory begins with a tiny "Proto-RNA" three billion years ago. As the earth is cooling and rain is filling up the oceans, this microscopic life begins, on its own, to "evolve" through:

- Natural Selection
- Environmental Pressure
- Positive Mutation

Ultimately fish turn into reptiles and 220 MYA mammals evolve and eventually develop into a more ape-like looking creature 6 MYA. All die off except for a small group in Africa that continue on the evolutionary process 200,000 YA who then leave Africa to migrate to every part of

the world. The development process continues till we get to where we are today. Homo Sapien-Sapien or (Wise Man)

Aliens: Evolution with “outside” help. The theory begins 35,000 years ago where *outside influences* or

“Aliens” enhanced our evolutionary process. Genetic manipulation by these space visitors improve our mental and physical characteristics from whatever residual ape-like genetics we still had, that gave us a needed boost to what we are today.

Then 5,000 years ago our space daddies visited again and left us with a body of technology that launched the sudden development of major civilizations throughout the world like Egypt, Sumer and the Indus Valley people. Some of these evidence are found in the construction of megalithic structures made of gigantic, impossible to move stones, plus the *out of context*, technologically advanced artifacts, occasionally discovered in layers of earth that should not contain anything of any human origin.

Adam: Creationism - Begins with a belief that the book of Genesis outlines a literal historical record of our origins and early human history. This record begins with a God who speaks planets into existence instantly with just a word uttered. He took 7 days to create all life on planet Earth some 6,000 years ago, and the present condition of our planet we see today, is the aftermath of a world-wide catastrophic flood some 4,500 years ago.

Our Museum's Position:

As we give proper representation and respect to each of these 3 theories, we ourselves plant our flag in the *Adam's Theory* camp. Which means, we are “Young Earth Creationist”, we first recognize that

The Ape Theory is the leader, as far as the recognition of evolution's influence in schools, TV, movies, books and science.

As far as *Alien Theory* - this has grown in popularity over the last 40 years and more recently with TV shows like *Ancient Aliens*. It does call into question certain "holes" in evolution and does so with enough "evidence" that we include it in this conversation.

But more importantly because of the under representation of the *Adam's Theory* many are unaware of its significance, what it is and how this theory operates with in the context of the body of evidence in history, science and religion. Our mission is to flesh it out, then present it clearly in an easy to understand and fun format.

Let's Sum it up: As you ponder this question and the 3 possible answers we believe there is a clear winner and that it makes sense as the jigsaw puzzle comes together and as you then zoom out and re-ask the question, "Is it Apes, Aliens, or Adam?"

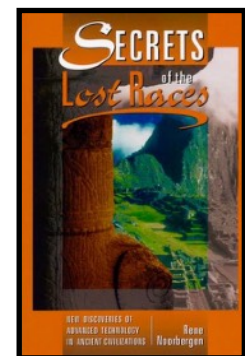

Are you ready to experience many profound "Ah-ha" moments?

So let's begin our journey...

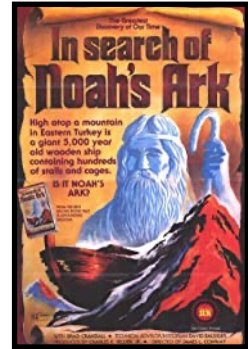

Museum Recommended Resources:

Books on Amazon

Secrets of the Lost Races (1978) by Rene Noorbergen
Does archeology, Noah's Ark and amazing ancient technology interest you? Instead of tracing it all back to Aliens or "monkeys", the author instead says humans started off stronger, taller and more advanced and then lost it along the way. As one Syracuse University history student exclaimed, "*After reading this book, I'm having to rethink everything I've learned*"

In Search of Noah's Ark (1976) by David Balsiger & Charles E. Sellier
Noah's Ark is the second major pillar of the creation theory and a highly controversial subject debated on the Internet. The most asked questions we get are: "Where is Noah's Ark?" "Could all the animals fit on board?" "Has anyone actually seen it?" Although this book is over 40 years old, you'll be surprised how many of these questions and more will be satisfied. An easy read and incredibly compelling content. Highly recommended.

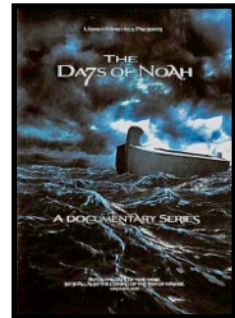

Watch on Amazon

The Days of Noah: The Flood - Part 1 (2019)

100 minutes in length.

A very comprehensive in-depth geological and historical retelling with incredible graphics of the catastrophic world-wide event given by creationists as the reason why we observe what we see in the fossil record. Theologians and scientists both weigh in on this fascinating journey back in time.

Mount St. Helens: Seeing Noah's Flood Through Geology (2013).

37 minutes in length.

Being able to demonstrate the forces of the world-wide flood of Noah and it's geological affect is a challenge, because no other event was as intense since that catastrophic episode. However the Mount St. Helens eruption of 1980 does give us a glimpse. In it you'll see evidence that Genesis is historically accurate with similar geological formations, like the grand canyon, forming in weeks, days or hours after this volcano's explosion.
